

Kibana Dashboard Issue

When going to a Kibana dashboard, Google Chrome is showing the site as insecure and issue with the Certificate.

This will happen because Certificates are tied to the IP address or domain name of the device. Upon first boot, Insight will generate a self-signed certificate that is tied to localhost since the device will not know what the final IP address or domain name will be.

If you will need a valid certificate, you will need to replace the self-signed certificate we generated with your own certificate.
